A textbook for managers

The target reader for this book is a manager who needs to clearly understand what "data science", "big data", "artificial intelligence" so that they can:

- **leverage** these technologies to improve the efficiency of their existing business,
- **innovate** with new products and services and develop new business guidelines

The promise of this book is to bring you from a starting point with no knowledge of these technical concepts, to a point where you understand the concepts **and** you can develop "data centric" business projects: when "data" contributes to creating value for the customer and all stakeholders.

Is this textbook too technical or too easy for me?

If you are unsure, try this simple test: <http://bit.ly/essentials-1-test>

→ There are 20 topics you should be comfortable answering. See how you score. If the score is low, you should read first the introductory volume to this series:

"Essentials of data science for managers: Volume 1, from big data to APIs"

The end
